

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

XXII. *An Account of an uncommon Phænomenon in Dorsetshire: In a Letter from John Stephens, M. A. to Emanuel Mendes da Costa, F. R. S.*

S I R,

Read April 9,
1761.

AS no essay, however imperfect, which tends to illustrate the operations of nature, can be unacceptable to the learned, I took the liberty to address myself to you, in setting forth the following short, but just account of a phænomenon observed in our own country, and, as far as I can recollect, not hitherto described.

In the month of August 1751, the air having been for some time remarkably hot and dry, was changed of a sudden by a heavy fall of rain, and a high south-west wind; the cliffs near Charmouth, in the western part of Dorsetshire, presently after this alteration of the atmosphere, began to smoke, and soon after they burned, with a visible though a subtil flame, for several days successively; and continued to smoke, and sometimes to burn, at intervals, till the approach of winter: nay, ever since that time, especially after any great fall of rain, thunder and lightning, or a high south-west wind (which drives the sea with great violence against the cliffs, and beats off large pieces of them), the cliffs continue to smoke, and sometimes to burn with a visible flame; which, during the summer months, is frequently observed in the night-time. On examining these cliffs, in the year 1759, I discovered a great quantity of pyrites,

not

not in any regular strata, but interspersed in large masses through the earth, and which proved to be martial; of marcasites, which yielded near one tenth part of common sulphur; of cornua ammonis of different sizes, and other shells, but of the bivalve class, which were crusted over, and as it were mineralized, with the pyritical matter; of belemnites, also crusted over with the like substance: and the cliffs, for near two miles long, and from the surface, to 35 or 40 feet deep, even to the rocks at high-water mark, were one bed of a dark coloured loam, strongly charged with bitumen. Moreover, I found also a dark coloured substance, resembling coal-cinder; some of which being powdered, and washed in distilled rain-water, upon filtrating the water, and evaporating it slowly to a pellicule, its salts shoot into fine crystals, and appear to be no more than a martial vitriol: one ounce of this cinder-like substance yields one drachm of salt. I gathered up about one hundred pounds weight of the different kinds of those pyritæ, marcasites, &c. which were laid in a heap, exposed to the air, and every day sprinkled with water: the consequence was, that, in about ten days time, they grew hot, soon after caught fire, burned for several hours, and fell into dust. Hence, therefore, it is imagined, that these martial and sulphurous fossils, by being exposed to the air and wet, by being agitated by the beating of the sea, and, if I may use the expression, by being electrified by the subtil flame of the lightning, take fire, which is favoured by the bituminous particles contained in the loam, and burn till all their phlogiston is consumed, and their iron, or martial earth, is dissolved in the acid of sulphur; which

which constitutes the martial vitriol, found to be near the one eighth part of this cinder-like matter.

When the cliffs were observed to burn in the night-time, the flame was plainly perceived by a spectator at a distance; but, when he drew near to the place, seemingly on fire, he could perceive a smoke, but no flame. In the day-time, nothing but a smoke was perceived, except the sun shined, when the cliffs appeared, at a distance, as if they were covered with pieces of glass, which reflected the sun's meridional rays; but, upon drawing near to the places, where these luminous appearances were perceived, they disappeared, and the cliffs seemed to be covered with smoke, which stunk of a bituminous and sulphureous matter.

I have also been an eye-witness of the same kind of flame arising from the Lodes in Cornwall, especially such, as contained a great quantity of mundic and martial pyrites. Three times I have seen this flame arise from the earth in the night, and once in the middle of the day. In the night, a person, standing at a little distance, would imagine, that the place was all on fire, and even on drawing near the same, he perceives himself surrounded with flame, but is not hurt; and in four or five minutes time, he perceives this flame to decrease, and fall into the earth. In the day-time, the flame is of a different colour, and not much unlike the flame, which arises from a furnace. There are several mines discovered in this county by these mineral fires, where there were no symptoms of such mines before: but it is generally observed, that they abound with marcasite and pyrites. Moreover, these mineral flames, arising

from ignited pyrites, are frequently discovered in the bottom of mines and coal-pits; and are often detrimental, and sometimes destructive, to the miners; which made the late learned Dr. Woodward, and others, imagine, that they were vapours arising from an abyss.

From what has been said therefore, we may, in my humble opinion, draw the following conclusions.

1. That all subterraneous fires, even those of Hecla, Vesuvius, and Ætna, together with those observed in the mines and coal-pits, are caused by the heat and fixing of pyrites and marcasites.

2. That the waters of our hot baths derive their heat from passing over a bed of ignited pyrites. Indeed the solid contents of those waters do evidently prove this assertion being nothing more than such particles of the pyrites as are soluble in water.

3. That these mineral flames will be more or less subtil, according to the minuteness of the particles of the combustible matter, and the quantity of phlogiston, which they contain.

4. That the convulsive motions and tremblings of the earth are caused by the heat of the burning pyrites expanding the air contained in its bowels. This is clearly proved, by their causing, immediately after, an eruption of the earth, which generally discharges a dark coloured cinder-like and frothy matter. And,

5. That those places, where the earth contains the greatest quantity of pyrites and marcasites, will be most liable to these convulsive motions and tremblings, no other natural cause, contradictory.

However, I shall, with great respect, submit these observations to the consideration of the President and
Fellows

Fellows of the Royal Society, to whom, Sir, if you will be so kind as to communicate them, you will greatly oblige,

S I R,

Your very humble servant, &c.

Woodstock-Street,
April 4, 1761.

John Stephens.

XXIII. *Additional Observations upon some Plates of white Glafs found at Herculanum: In a Letter to Charles Morton, M. D. R. S. S. By J. Nixon, A. M. and F. R. S.*

Dear Sir,

Read April 9, 1761. **I**N a paper, which I had the honour to present to this learned Society about * two years ago, I offered my thoughts upon some plates of white glafs found in the ruins of Herculanum. I now beg leave to add some more observations, with a view partly to explain and support what I then delivered, and partly to communicate such new informations, as I have since received, relating to the same subject.

I observed †, upon the authorities produced by Monf. Renaudot ‡, that glafs plates were not applied
